

Upgoing thumb sign: A sensitive indicator of brain involvement

Neurology® 2018;90:396. doi:10.1212/WNL.0000000000004992

In the article “Upgoing thumb sign: A sensitive indicator of brain involvement?” by Hachinski et al.,¹ there are several errors in the reported number of patients diagnosed with stroke or stroke mimics. The caption for figure 2 should state “The frequency of thumb sign in patients with stroke/TIA (n = 113) and stroke mimics (n = 55)” rather than “The frequency of thumb sign in patients with stroke/TIA (n = 116) and stroke mimics (n = 52),” as originally published. In the Results, lines 8–10 should read “One hundred thirteen patients were diagnosed with a stroke or TIA (67.0%), and 55 as stroke mimics (33.0%)” rather than “One hundred sixteen patients were diagnosed with a stroke or TIA (69.0%), and 52 as stroke mimics (31.0%),” as originally published. Finally, the second column in table 1 should be labeled “Thumb sign (n = 25)” rather than “Thumb sign (n = 22)” as originally published. The authors regret the errors.
