

Notable from Our Podcast

The April 17, 2018, podcast featured interview highlighted a Resident & Fellow Clinical Reasoning case describing a woman with symmetrical weakness and behavioral disturbance. For our What's Trending feature of the week, you will hear a discussion on thrombectomy vs standard medical therapy alone for treatment of stroke.

Author Tip

Neurology recently adopted the following policy in support of the movement to promote data transparency: Data not provided in a *Neurology* article, because of space limitations, must be made available in a trusted data repository or shared at the request of other investigators for purposes of replicating procedures and results. *Neurology* has created a mechanism for editors and peer reviewers to review data deposited in the Dryad public repository at the time of manuscript submission. Authors will pay a nominal fee for depositing data in a public repository (waivers exist for submissions from authors based in countries classified by the World Bank as low- or middle-income economies).

Brain structure linked to symptoms of restless legs syndrome

People with restless legs syndrome may have changes in a portion of the brain that processes sensory information. "Our study, which we believe is the first to show changes in the sensory system with restless legs syndrome, found evidence of structural changes in the brain's somatosensory cortex, the area where sensations are processed," said study author Byeong-Yeul Lee, PhD, of the University of Minnesota in Minneapolis. "It is likely that symptoms may be related to the pathologic changes in this area of the brain."
