

## Notable from Our Podcast

The November 27th podcast's featured interview highlights a population-based study on early predictors of mortality in parkinsonism and Parkinson disease. For our What's Trending feature of the week, you will hear a discussion on the natural history of stiff-person syndrome. [NPub.org/podcast](http://NPub.org/podcast)

## Author Tip

*Neurology*<sup>®</sup> strives to publish superb studies in clinical neurology. Peer reviewers' opinions of manuscripts are invaluable in assisting the Editor-in-Chief and Associate Editors in making their decisions. In addition to helping assess the value of a manuscript for the scientific literature and *Neurology* in particular, reviewers help authors to improve their manuscripts by recommending areas for the author to address (either for *Neurology* or an alternate journal if a manuscript is ultimately rejected by *Neurology*).

In return for reviewing, you will keep up with the field and gain understanding that will improve the quality of your own studies and how you report them. In appreciation of your service to the journal, your name will be included in a list we publish twice each year of reviewers who have reviewed for us during the past 6 months. Superb reviewers may be chosen to sit on *Neurology's* Editorial Board.

If you are interested in reviewing, contact us at [journal@neurology.org](mailto:journal@neurology.org) and include a series of keywords on topics in which you have expertise to help us determine appropriate papers for you to review.

### Spinal muscular atrophy drug may help kids with later-onset disease

There is now further evidence that a drug that is effective in treating the rare muscle-wasting disease spinal muscular atrophy (SMA) early in life may be associated with improvement in older children. "This study involved kids up to age 15 years at enrollment with SMA types II and III, and they were followed for approximately 3 years, so we were excited to see that the drug can show benefit for these older kids too and that the benefit can extend for this period of time," said study author Basil T. Darras, MD, of Boston Children's Hospital and Harvard Medical School and a member of the American Academy of Neurology.
