October 1, 2019 issue

This issue contains a Pearls & Oy-sters that shows isolated prosopagnosia as the presenting complaint in glioblastoma. The Teaching NeuroImages case shows Collet-Sicard syndrome and hearing loss with glomus jugulotympanicum. A Teaching Video NeuroImages case describes slow periodic myoclonus in subacute sclerosing panencephalitis and fulminant Wilson disease.

Pearls & Oy-sters: Isolated prosopagnosia as the presenting complaint in glioblastoma: The face of deception

In this article, we present a patient with glioblastoma involving predominantly the right temporo-occipital lobe, whose primary complaint was prosopagnosia. We use this opportunity to discuss other related etiologies as well as neuroanatomy of prosopagnosia.

Page 642

Teaching NeuroImages: Collet-Sicard syndrome and hearing loss with glomus jugulotympanicum

In this article, we present a patient presenting with progressive involvement of cranial nerves IX-XII suggesting jugular foramen and hypoglossal canal involvement, as well as cranial nerve VIII involvement.

Page e1408

Teaching Video NeuroImages: Slow periodic myoclonus in subacute sclerosing panencephalitis and fulminant Wilson disease

We document slow periodic myoclonus in a 34-year-old Peruvian man who developed paranoid schizophrenia and, 6 months later, levodopa-unresponsive parkinsonism and falls, progressing into akinetic mutism.

October 8, 2019 issue

This issue starts with a Clinical Reasoning article about a challenging case of spinal cord sarcoidosis. The issue also includes a Teaching NeuroImages case that demonstrates that acute hemorrhage may not be seen on susceptibility-weighted imaging. A Teaching Video NeuroImage discusses using the tuning fork to diagnose vertigo.

Clinical Reasoning: A 55-year-old woman presenting with ataxia and numbness 1 year after ileum resection

We describe a challenging case of spinal cord sarcoidosis. This case offers the opportunity to explore, in a clinically oriented way, the wide range of differential diagnosis of a myelopathy with subacute onset.

Page 675

Teaching NeuroImages: Failing to see blood on SWI

This image demonstrates that acute hemorrhage may not be seen on susceptibility-weighted imaging, which has been previously regarded as being very sensitive for blood.

Page e1495

Teaching Video NeuroImages: Use the tuning fork to diagnose vertigo

A short video case shows that the tuning fork can be helpful to diagnose vertigo and identify the affected labyrinth.

October 15, 2019 issue

The Clinical Reasoning article in this issue presents a case of mechanical thrombectomy for acute ischemic stroke in the setting of atrial myxoma. This issue also includes the 2019 CNRF Essay Contest Winner, “Art and the restoration of identity in dementia,” as a Right Brain article. The Teaching Video NeuroImage featured this issue describes vertical one-and-a-half syndrome.

Clinical Reasoning: Mechanical thrombectomy for acute ischemic stroke in the setting of atrial myxoma

In this article, we describe the presentation and hospital course of a young patient who presented with an acute left middle cerebral artery syndrome due to an atrial myxoma treated with IV tissue plasminogen activator and endovascular thrombectomy with subsequent removal of the cardiac tumor.

Page e1572

Right Brain: Art and the restoration of identity in dementia

This was chosen as the winner of the 2019 CNRF Essay contest. While we lack a disease-modifying therapeutic for Alzheimer disease and related disorders, there is hope to help restore identity throughout the progression of dementia.

Page 719

Teaching Video NeuroImages: Vertical one-and-a-half syndrome

We describe a case of a 51-year-old woman presenting with weakness and diplopia, who on examination had bilateral upgaze palsy and right infraduction deficit, overcome with doll's head maneuver.

Page e1577

October 22, 2019 issue

The Clinical Reasoning case in this issue presents a case of acute encephalopathy and rigidity in a 30-year-old man. This issue also features 2 Teaching NeuroImages. The first discusses diffuse cerebrovascular susceptibility artifact following ferumoxytol infusion. The second describes electroretinographic artifacts in EEG.

Clinical Reasoning: A case of acute encephalopathy and rigidity in a 30-year-old man

We describe a case of an inflammatory leukoencephalopathy secondary to presumed levamisole-contaminated cocaine use, associated with concomitant cocaine-induced neurotoxicity (neuroleptic malignant syndrome). We outline the clinical presentation, diagnostic evaluation, a variety of differential diagnoses, and treatment.

Page 759

Teaching NeuroImages: Diffuse cerebrovascular susceptibility artifact following ferumoxytol infusion

A 79-year-old woman presented with dysarthria, aphasia, and right hemiparesis. Due to her religious beliefs (Jehovah's Witness), her anemia is treated with ferumoxytol infusions rather than red blood cell transfusion.

Page e1662

Teaching NeuroImages: Electroretinographic artifacts in EEG

The image demonstrates electroretinogram (ERG) artifacts in a patient who had hypoxic ischemic encephalopathy and electrocerebral inactivity throughout the EEG recording except for the ERG waveforms.

October 29, 2019 issue

The Mystery Case in this issue discusses Cowden syndrome presenting with paraneoplastic encephalitis. This issue also features 2 Teaching NeuroImages. The first reports a rare case of Metachromatic Leukodystrophy with multiple bilateral cranial nerve enhancement. The second describes spinal cord herniation after cervical corpectomy.

Mystery Case: Cowden syndrome presenting with paraneoplastic encephalitis

This patient was initially diagnosed with paraneoplastic encephalitis. However, further physical manifestations including macrocephaly, skin lesions, and many tumors in this patient pointed to the diagnosis of Cowden syndrome and underlying genetic cause.

Page 813

Teaching NeuroImages: A rare case of metachromatic leukodystrophy with multiple bilateral cranial nerve enhancement

A 32-month-old boy, born at term, presented with progressive developmental regression from 14 months of age. On examination, he had horizontal nystagmus, diminished gag reflex, hypertonicity, and depressed reflexes.

Page e1742

Teaching NeuroImages: Spinal cord herniation after cervical corpectomy

A 48-year-old man presented with worsening generalized pain. He had a history of complex cervical deformity and C2-T4 anterior and posterior instrumented fusions.

Sign Up for the AAN’s Axon Registry

The AAN encourages its US members to show their interest in participating in the Axon Registry® by signing up today.

Use the Axon Registry to:

- Simplify reporting requirements under MACRA’s Quality Payment Program and avoid penalties while reducing your administrative burden
- Meet your MOC Part IV requirements and waive up to eight credits of Part II Self-Assessment
- Choose from 22 AAN neurology-specific quality measures that fit your practice
- Use data to understand your practice and identify where improvements can be made to patient care
- Manage your patients at a population level; look at a specific group of patients based on conditions, risk factors, demographics or outcome
- Demonstrate your value to payers when negotiating reimbursement
- Enjoy multi-year, fee-free access when you sign the agreements and integrate your EHR with the registry

Learn more at [AAN.com/view/Axon](https://aan.com/view/Axon) and send your questions to registry@aan.com.
